1. Main characteristics

- Zero false alarm rate
- Real-time response
- Correct data
- Minimum distinguishable particle diameter :0.3 micrometer
- High anti-interference performance because of the patent structure of six sides shielding
- Optional direction of air inlet and outlet in order to adapt the different design

2. Overview

PMS5003 is a kind of digital and universal particle concentration sensor,which can be used to obtain the number of suspended particles in the air,i.e.the concentration of particles,and output them in the form of digital interface. This sensor can be inserted into variable instruments related to the concentration of suspended particles in the air or other environmental improvement equipments to provide correct concentration data in time.

3. Working principle

Laser scattering principle is used for such sensor, i.e. produce scattering by using laser to radiate suspending particles in the air, then collect scattering light in a certain degree, and finally obtain the curve of scattering light change with time. In the end, equivalent particle diameter and the number of particles with different diameter per unit volume can be calculated by microprocessor based on MIE theory. Please find the functional diagram of each part of sensor from Figure 1 as follows.

4. Technical Index

Parameter	Index	unit
Particle Range of measurement	0.3~1.0；1.0~2.5；2.5~10	Micrometer（μm）
Particle Counting Efficiency	50%@0.3μm 98%@>=0.5μm	

Particle Effective Range（PM2.5 standard）	0~500	μg/m³
Particle Maximum Range（PM2.5 standard）*	≥1000	μg/m³
Particle Resolution	1	μg/m³
Particle Maximum Consistency Error (PM2.5 standard data)*	±10%@100~500μg/m³ ±10μg/m³@0~100μg/m³	
Particle Standard Volume	0.1	Litre（L）
Single Response Time	＜1	Second（s）
Total Response Time	≤10	Second（s）
DC Power Supply	Typ:5.0 Min:4.5 Max: 5.5	Volt（V）
Active Current	≤100	Milliampere（mA）
Standby Current	≤200	Milcroampere（uA）
Interface Level	L <0.8 @3.3 H >2.7@3.3	Volt（V）
Working Temperature Range	-10~+60	℃
Working Humidity Range	0~99	%
Storage Temperature Range	-40~+80	℃
MTTF	≥3	Year(Y)
Physical Size	50×38×21	Millimeter（mm）

Note 1: Maximum range means that the highest output value of the PM2.5 standard data is not less than 1000.

Note 2:“PM2.5 standard data” is the “data2” in the appendix A.20℃，50%.

5. Output result

1) Mainly output as the quality and number of each particles with different size per unit volume, the unit volume of particle number is 0.1L and the unit of mass concentration is μg/m³.
2) There are two options for digital output: passive and active. Default mode is active after power up. In this mode sensor would send serial data to the host automatically. The active mode is divided into two sub-modes:stable mode and fast mode. If the concentration change is small the sensor would run at stable mode with the real interval of 2.3s.And if the change is big the sensor would be changed to fast mode automatically with the interval of 200~800ms, the higher of the concentration, the shorter of the interval.

6. Pin Definition

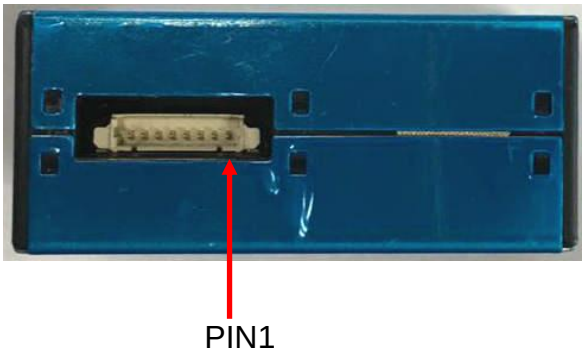

Figure 2 Connector Definition

Pin number	Pin name	Description
PIN1	VCC	Positive power 5V
PIN2	GND	Negative power
PIN3	SET	Set pin/TTL level @3.3V, high level or suspending is normal working status, while low level is sleeping mode.

PIN4	RXD	Serial port receiving pin/TTL level@3.3V
PIN5	TXD	Serial port sending pin/TTL level@3.3V
PIN6	RESET	Module reset signal/TTL level@3.3V, low reset
PIN7	NC	
PIN8	NC	

7. Typical Circuit

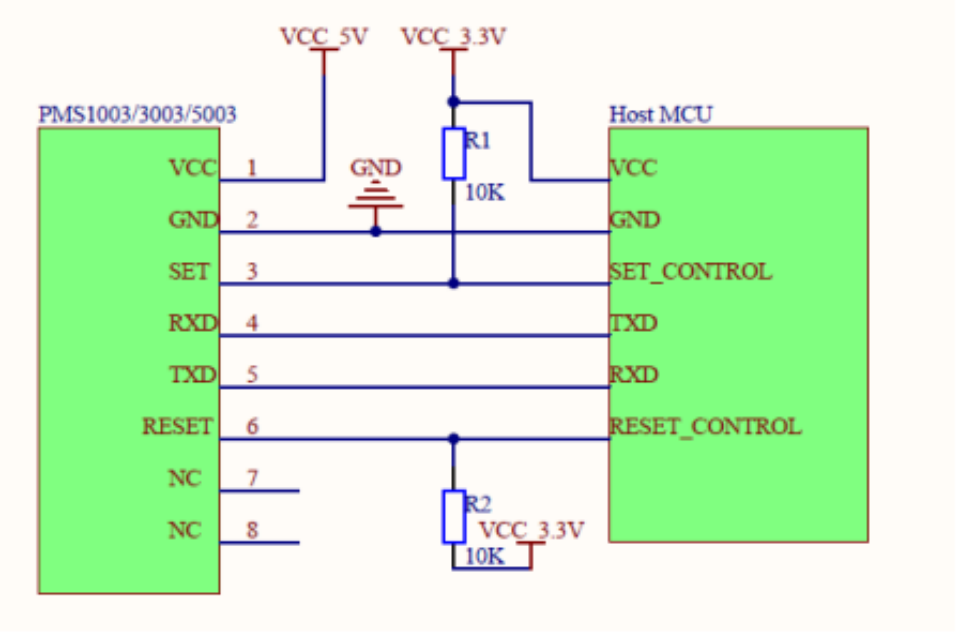

Figure 3 Typical Circuit

8. Circuit Attentions

1) DC 5V power supply is needed because the FAN should be driven by 5V. But the high level of data pin is 3.3V. Level conversion unit should be used if the power of host MCU is 5V.
2) The SET and RESET pins are pulled up inside so they should not be connected if without usage.
3) PIN7 and PIN8 should not be connected.
4) Stable data should be got at least 30 seconds after the sensor wakeup from the sleep mode because of the fan's performance.

13. Installation Attentions

1) Metal shell is connected to the GND so be careful not to let it shorted with the other parts of circuit except GND.

2) The best way of install is making the plane of inlet and outlet closely to the plane of the host. Or some shield should be placed between inlet and outlet in order to prevent the air flow from inner loop.
3) The blowhole in the shell of the host should not be smaller than the inlet.
4) The sensor should not be installed in the air flow way of the air cleaner or should be shielded by some structure.
5) The sensor should be installed at least 20cm higher than the grand in order to prevent it from blocking by the flock dust.
6) When the sensor is used to outdoor fixed equipment, the equipment should be completed for the protection of sandstorm,rain,snow,etc.
7) Do not break up the sensor.

14. Other Attentions

1) Only the consistency of all the PM sensors of PLANTOWER is promised and ensured. And the sensor should not be checked with any third party equipment.
2) The sensor is usually used in the common indoor environment. So some protection must be added if using in the conditions as followed:
   a) The time of concentration ≥300μg/m³ is longer than 50% of the whole year or concentration≥500μg/m³ is longer than20% of the whole year.
   b) Kitchen
   c) Water mist condition such as bathroom or hot spring.
   d) Outdoor
